# Program 1: Dynamic Text Display with useState

1. Use create-react-app to set up a new project. Edit the App.js file to include a stateful component with useState. Add an input field and an element that displays text based on the input. Dynamically update the content as the user types.

Step-1: Create React Application

```
npx create-react-app my-dynamic-app
```

Step-2: Modify App.js

```
import { useState } from 'react';

export default function App() {
  const [text, setText] = useState('');

  return (
    <div className="App">
      <h1>Dynamic Text Display</h1>
      <input
        value={text}
        onChange={(e) => setText(e.target.value)}
        placeholder="Type something..."
      />
      <p>You typed: {text}</p>
    </div>
  );
}
```
